

2011-12 PreAP Harmonic Motion 8

1. A mechanical vibrator is attached to an elastic string. At particular frequencies it forms the given shapes.
 - A. Since these are produced on the same string (without modification) these five shapes are known as:
 - B. The first shape on the left has three names (see previous homework):
 - C. * The wavelength of the first harmonic is always equal to:
 - D. Fill in the chart. Again, notice the asterisks.
 - E. Harmonic 5 has ____ antinodes and ____ nodes.
 - F. Notice that each antinodes is completed by ____ nodes.
 - G. The meterstick is turned to measure the distance the string moves from one side to the other. What is the amplitude of its motion?

For the next two questions, be sure to start with the formula. Put in the change, then follow the math.

2. On planet Xorgon the acceleration due to gravity is 1/2 that of the earth's.
 - A. * By what factor would the period of a pendulum change on Xorgon?
 - B. * By what factor would the period of a spring-mass system change on Xorgon?
3. A pendulum is moved to planet Pidronium where the acceleration due to gravity is 1/8 the strength of the earth's. (Careful!) What is the change in frequency of the pendulum?

4. Two waves are shown above. If they were to pass thru a string at the same time they would combine together. This is known as superposition.
 - A. * Wave 1's wavelength is: _____ It's amplitude is: _____
 - B. Wave 2's wavelength is: _____ It's amplitude is: _____

Notice the circle on both waves. Here is how you do the superposition: add the amplitudes together.

 - C. * What is the total amplitude of the two circled positions?
 - D. Put this new, net amplitude together onto the blank graph at 0.25 seconds.
 - E. Do this for each point on the two graphs and draw the combined wave.

5. In which materials is the speed of sound greater:
- A. Solids or gases?
 - B. Dense or non-dense materials?
 - C. Fast vibrating or slowly vibrating molecules?
 - D. Hot air or cold air?
 - E. Air at 273K or 20°C?
6. A string has a length of 0.8m.
- A. * What is the wavelength of the natural frequency (first harmonic) of this string?
 - B. What are the wavelengths of the first 3 harmonics of the string?
 - C. If the speed of the wave on the string is 24 m/s, what is the frequency of the fundamental?
 - D. What are the frequencies for the first 3 harmonics of the string?

Q1C) $2L$ Table asterisks: $\lambda_2 = 0.5 \text{ m}$; $v = 9 \text{ m/s}$

Q2A) put $g/2$ in denominator. Mult by reciprocal and the 2 goes next to the ℓ , which means $T_{\text{Xorgon}} = \text{square root of } 2 \text{ times } T_{\text{Earth}}$ or $= 1.414T_{\text{Earth}}$.

Q2B) no change. g is not in the eq for a spring.

Q4A) $\lambda = 1 \text{ m}$; Amp = -2 m

Q4C) Net ampl = $-2 + 1 = -1 \text{ m}$

6A) always = $2L$, so 1.6 m
